

Boom Extensions for davits and cranes—

A boom extension is a simple and cost effective way to increase the total reach of your MarQuipt davit or crane for lifting lighter weight objects. Using the extension trades increased boom length for a lower weight-lifting capacity.

A boom extension is frequently used to reach a small personal watercraft or scooter stowed alongside the primary tender. Boom extensions can also be helpful for lowering equipment through engine room hatches or spare props over the stern.

Slip-on style boom extensions— (shown top right)

- Simply slips over the end of the boom when needed.
- No modification of the davit required.
- Stows separately- bring it out only when extended reach is needed.
- Examples of currently designed and available models are listed below. Other lengths/capacities and extensions for other davit models are available on request:

Tenderlift Classic (1000 LB capacity davit)

Reach—	Lift Capacity—
+34" @ 30°	400 LBS (180 KG)
+46" @ 30°	300 LBS (135 KG)
+58" @ 30°	200 LBS (90 KG)

Tenderlift 2 (1500 LB capacity davit)

Reach—	Lift Capacity—
+32" @ 0°	1000 LBS (455 KG)
+48" @ 30°	1000 LBS (455 KG)

Fold-under style boom extensions— (shown bottom right)

Fold-under extensions are permanently attached to the davit and stow conveniently beneath the boom when not needed. For davits of up to 1700 LBS lifting capacity, fold-under and slip-on boom extensions work equally well, and the choice between them is primarily determined by stowage and/or installation considerations. Fold-under extensions are the only option with larger cranes, where the increased size and weight of the extension itself makes a slip-on extension impractical.

- Available for most MarQuipt non-telescoping davits and cranes.
- Various lengths and lift capacities.
- Maximum extension length and lifting capacity is dependent on the davit or crane model and the extension type.
- Painted to match your davit's finish.
